Benthic Index of Biological Integrity		BIBI
Low biological integrity		0 - 24
Moderate biological integrity		25 - 39
High biological integrity		≥ 40

*1998-99: Volunteers picked/removed invertebrates from organic debris

**2000: Changes monitoring protocol to gather 3 replicate samples from 3 different riffles resulting in overall larger sample sizes

***2003: Samples now taken from late June -- mid-August.

From 1998-2002 samples for all streams were taken on the same day in late September, but many creeks/streams were often dry.
